

Connect Claude Code to Your Contact Center

*This connects **Claude Code** to your company's Webex Contact Center (WxCC) configuration — teams, queues, sites, skills, and more — so you can ask questions and make changes in plain English, using your own Webex sign-in, with a safety check before anything is saved.*

You don't need to write code, understand the underlying APIs, or install anything beyond Claude Code itself. This uses something called **MCP** (Model Context Protocol) — a standard way of giving Claude a specific set of tools to work with. You don't need to understand MCP either; "connecting an MCP server" is just what the steps below do. Nobody's password or account is shared — you sign in as yourself, and this connection only ever sees what your own Webex account is already allowed to see in your tenant.

New to Claude Code? It's a command-line AI assistant — you type a request in plain English at a prompt, and it responds, asks clarifying questions, or takes an action, the same way you'd talk to a person.

What you'll need before you start

Get these **three things** from whoever manages this connection for your company (your Contact Center admin or IT contact). Do not guess or reuse anything from another project:

Item	What it looks like	How sensitive is it?
Connection URL	<code>https://wxcc-mcp-xxxxx.us-central1.run.app/mcp?org=xxxxxxxx-xxxx-...</code>	Not secret, but specific to your company
Client ID	A short identifier string	Not secret, but specific to your company
Client Secret	A longer string	Treat like a password. Ask for it over a secure channel, not plain email or chat if you can help it — and never paste it anywhere public

You'll also pick **one thing yourself**: a short name for this connection, with no spaces — for example `wxcc-cloud-acme` if your company were named Acme. You'll use this name every time you ask Claude about your contact center.

You also need to be a **Contact Center administrator** for your organization's Webex tenant. If you're not sure whether you are, ask whoever gave you the three items above — this setup uses *your own* sign-in, so it only works if your account already has that access.

Claude Code itself requires a paid plan — a Claude Pro or Max subscription, or an Anthropic Console account with billing set up. A free `claude.ai` chat account is not enough on its own. If you don't already have Claude Code, check with whoever shared this document — they may have sent a referral link that includes a free trial period.

1. Confirm Claude Code is installed

Open a terminal and run:

```
claude --version
```

If that prints a version number, skip to Step 2. If it says the command isn't found, install Claude Code first — see code.claude.com for instructions — then come back here. (You'll need a paid plan or trial to sign in — see the note above if you don't have one yet.)

2. Connect — one command

Fill the three items from your admin (and the name you picked) into the command below, then run it.

On macOS or Linux:

```
MCP_CLIENT_SECRET=PASTE_YOUR_CLIENT_SECRET claude mcp add-json wxcc-cloud-yourname '{"type":"http","url":"PASTE_YOUR_CONNECTION_URL","oauth":{"clientId":"PASTE_YOUR_CLIENT_ID","callbackPort":8484,"scopes":"cjp:config_read cjp:config cjp:config_write"}}' --client-secret --scope user
```

On Windows (PowerShell):

```
$env:MCP_CLIENT_SECRET = "PASTE_YOUR_CLIENT_SECRET"
claude mcp add-json wxcc-cloud-yourname '{"type":"http","url":"PASTE_YOUR_CONNECTION_URL","oauth":{"clientId":"PASTE_YOUR_CLIENT_ID","callbackPort":8484,"scopes":"cjp:config_read cjp:config cjp:config_write"}}' --client-secret --scope user
```

Replace, in the command you use: - `wxcc-cloud-yourname` — the name you picked (appears twice) - `PASTE_YOUR_CLIENT_SECRET` — the Client Secret - `PASTE_YOUR_CONNECTION_URL` — the whole Connection URL, including the `?org=...` part at the end — that's what points this at your specific organization - `PASTE_YOUR_CLIENT_ID` — the Client ID

This command only needs to run **once**. `--scope user` means it works from any folder on your computer from now on, and there's no separate approval step to complete — you're ready to sign in immediately after it succeeds.

3. Sign in

```
claude mcp login wxcc-cloud-yourname --no-browser
```

(using the name you picked)

This prints a long web address. Then:

1. **Copy that address.**
2. **Open a private/incognito browser window** — do this even if you don't think you're signed in anywhere else. It avoids Claude accidentally reusing a leftover Webex session that isn't yours.
3. **Paste the address into that private window** and press enter.
4. **Sign in with the Webex account** that is a Contact Center administrator for your organization.
5. After you approve, the browser will try to redirect to a `localhost` address and will likely show a **"can't reach this page" / "connection refused"** error. **This is expected** — the important part already happened. Copy the full address from the browser's address bar at that point.
6. **Return to your terminal and paste that address in** when prompted.

If this succeeds, you're connected.

4. Verify you're talking to the right organization

Ask Claude, in plain English:

```
Run wxcc_whoami on wxcc-cloud-yourname
```

(using the name you picked). Claude will state your organization's name and whether it's flagged as a production tenant. **Check that this is the organization you expect before asking it to do anything else.** If it isn't, stop and tell whoever gave you the connection details — don't try to fix it yourself.

How this behaves once you're connected

- **Reading is always safe.** Asking "how many," "list," or "find" questions never changes anything.
- **Changes are never immediate.** If you ask Claude to create, update, or delete something, it first shows exactly what it's about to do and waits for you to confirm — nothing is saved until you say so.
- **Claude double-checks its own writes.** After you confirm a change, it reads the object back to prove the change actually took effect, rather than trusting a success message.

- **Deletions that would break something are refused, not attempted.** If another team, queue, or user still depends on what you're trying to delete, Claude tells you exactly what — instead of the delete failing partway through.
- **This connection only ever reaches your one organization.** There's no way to accidentally point a request at a different company's data through this setup.

Example prompts and what to expect

Try these after connecting — they aren't real requests. Swap in your own team, site, or queue names once you've confirmed you're on the right tenant.

You could ask	What you should get back
"Run wxcc_whoami"	Confirms the connection works, and states your organization's name and whether it's a production tenant
"How many teams do we have?"	A single number — the total team count
"List our sites"	A short list of site names, each marked active or inactive
"Find the queue named Sales"	Details about that one queue — its service-level threshold, routing type, and which teams serve it
"What wrap-up codes exist?"	A list of wrap-up code names
"Create a site called Test Office"	Nothing is created yet — a preview of exactly what would be sent, and a request for you to confirm
"Yes, go ahead" (right after that preview)	Only now does the site actually get created, followed by a read-back confirming it exists
"Delete the team named X" (when something still depends on it)	A refusal, with a list of exactly what's still using it — not a failed attempt

Questions, or something not matching what you see? Ask whoever manages this connection for your organization.
